On the next several pages, you'll read brief profiles of two students who are applying to medical school to become doctors. The applicants will appear two at a time, along with some information about each student's background and qualifications.

*Attributes should be fully randomized by task (i.e., pairing). Attribute **categories** should be randomized across respondents but fixed within them (i.e., the categories (e.g., Grades, Race) should remain in the same order for each respondent for all tasks but the categories should be randomized so that different respondents see different orderings of the attribute categories).*
